

# TUF-FLEX

## Hardened Center Rods

### INTRODUCING Noffsinger Manufacturing's TUF-FLEX Rods

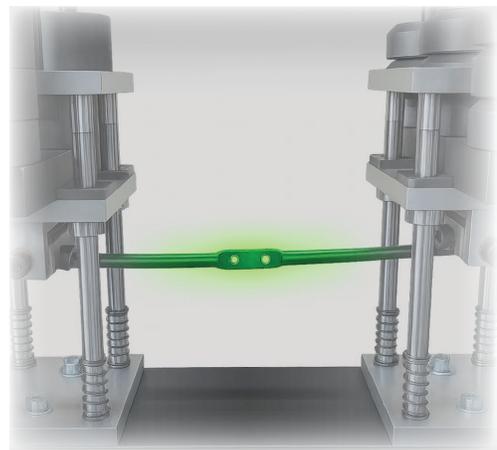

Noffsinger Manufacturing has always provided fully heat-treated 2-belt rods as part of our standard manufacturing process. We are now excited to introduce the option for fully heat-treated center forges, available on primary 3-belt webs. Testing demonstrates these rods are 13 times stronger than non-heat-treated rods, enabling them to withstand heavier loads and the most demanding conditions. Our in-house processing ensures rapid response times and delivers unmatched value in the industry.

Noffsinger Manufacturing's new fully heat-treated 3-belt rods demonstrate a 13-fold increase in strength compared to non-heat-treated rods, validated through rigorous in-house and field testing, ensuring exceptional performance under high loads and severe environmental conditions.

Optional fully heat-treated center forges, available in primary 3x60 webs, significantly enhance rod durability and load-bearing capacity through optimized material properties.

In-house heat treatment processes ensures consistent quality and rapid production, maintaining high strength and reliability across applications.
